Docket No. 0505-1212P Appl. No. 10/619,624 Amendment dated February 15, 2005 Reply to Office Action of November 19, 2004 Page 3 of 17

AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A clutch connection/disconnection detection system for a single-cylinder engine, for detecting the connection/disconnection of a clutch intermediately provided between a crankshaft of said single-cylinder engine and a power transmission means for transmitting mechanism that transmits the output of said crankshaft comprising:

a rotation variation coefficient detection means for detecting detector that detects the rotation variation coefficient of said crankshaft; and

a decision means for deciding mechanism that decides the connection/disconnection of said clutch by comparing said rotation variation coefficient detected by said rotation variation coefficient detection means detector with a preliminarily determined threshold.

- 2. (Original) The clutch connection/disconnection detection system for a singlecylinder engine as set forth in claim 1, wherein said threshold is preliminarily set according to engine speed.
- 3. (Original) The clutch connection/disconnection detection system for a single-cylinder engine as set forth in claim 1, and further including a rotating disk operatively connected to the crankshaft for rotation therewith and a pulser displaced a predetermined distance relative to the rotating disk for detecting the rotation thereof.

Docket No. 0505-1212P Appl. No. 10/619,624 Amendment dated February 15, 2005 Reply to Office Action of November 19, 2004 Page 4 of 17

- 4. (Original) The clutch connection/disconnection detection system for a single-cylinder engine as set forth in claim 3, wherein a plurality of projections extend from the rotating disk and said pulser detects each projection during rotation for outputting a pulse signal for each time a projection is detected.
- 5. (Original) The clutch connection/disconnection detection system for a single-cylinder engine as set forth in claim 4, wherein nine projections extend from the rotating disk and wherein pulse signals for stages 0 to 17 are assigned during two revolutions of the crankshaft.
- 6. (Original) The clutch connection/disconnection detection system for a single-cylinder engine as set forth in claim 5, wherein stages 4 to 6 correspond to a combustion stroke of the engine.
- 7. (Original) The clutch connection/disconnection detection system for a single-cylinder engine as set forth in claim 5, wherein stages 7 to 12 correspond to an exhaust stroke of the engine.

8. (Original) The clutch connection/disconnection detection system for a single-

cylinder engine as set forth in claim 5, wherein stages 13 to 15 correspond to an intake

stroke of the engine.

9. (Original) The clutch connection/disconnection detection system for a single-

cylinder engine as set forth in claim 5, wherein stages 16 to 3 correspond to a compression

stroke of the engine.

10. (Original) The clutch connection/disconnection detection system for a single-

cylinder engine as set forth in claim 1, wherein the rotation variation coefficient is calculated

as follows:

TSRAT = (TSA4-TSH4)/ME4U

where: TSRAT is the rotation variation coefficient,

TSA4 is the time of a compression stroke of the engine,

TSH4 is the time of the exhaust stroke of the engine, and

ME4U is the time for two revolutions of the crankshaft.

11. (Currently Amended) A method for detecting clutch connection/disconnection

for a single-cylinder engine, for detecting the connection/disconnection of a clutch

intermediately provided between a crankshaft of said single-cylinder engine and a power

transmission means for transmitting mechanism that transmits the output of said

crankshaft, said method comprising the following steps:

detecting a rotation variation coefficient of said crankshaft; and

deciding the connection/disconnection of said clutch by comparing said rotation

variation coefficient detected by said rotation variation coefficient detection means of the

crankshaft with a preliminarily determined threshold.

12. (Original) The method for detecting clutch connection/disconnection for a

single-cylinder engine as set forth in claim 11, wherein said threshold is preliminarily set

according to engine speed.

13. (Original) The method for detecting clutch connection/disconnection for a

single-cylinder engine as set forth in claim 11, wherein the detecting step includes a

rotating disk operatively connected to the crankshaft for rotation therewith and a pulser

displaced a predetermined distance relative to the rotating disk for detecting the rotation

thereof.

14. (Original) The method for detecting clutch connection/disconnection for a single-cylinder engine as set forth in claim 13, wherein a plurality of projections extend from

single-cylinder engine as set forth in daini 15, wherein a plurality of projections extend from

the rotating disk and said pulser detects each projection during rotation for outputting a

pulse signal for each time a projection is detected.

15. (Original) The method for detecting clutch connection/disconnection for a

single-cylinder engine as set forth in claim 14, wherein nine projections extend from the

rotating disk and wherein pulse signals for stages 0 to 17 are assigned during two

revolutions of the crankshaft.

16. (Original) The method for detecting clutch connection/disconnection for a

single-cylinder engine as set forth in claim 15, wherein stages 4 to 6 correspond to a

combustion stroke of the engine.

17. (Original) The method for detecting clutch connection/disconnection for a

single-cylinder engine as set forth in claim 15, wherein stages 7 to 12 correspond to an

exhaust stroke of the engine.

18. (Original) The method for detecting clutch connection/disconnection for a

single-cylinder engine as set forth in claim 15, wherein stages 13 to 15 correspond to an

intake stroke of the engine.

19. (Original) The method for detecting clutch connection/disconnection for a

single-cylinder engine as set forth in claim 15, wherein stages 16 to 3 correspond to a

compression stroke of the engine.

20. (Original) The method for detecting clutch connection/disconnection for a

single-cylinder engine as set forth in claim 11, wherein the rotation variation coefficient is

calculated as follows:

TSRAT = (TSA4-TSH4)/ME4U

where: TSRAT is the rotation variation coefficient,

TSA4 is the time of a compression stroke of the engine,

TSH4 is the time of the exhaust stroke of the engine, and

ME4U is the time for two revolutions of the crankshaft.

- 21. (New) The clutch connection/disconnection detection system for a single-cylinder engine as set forth in claim 1, wherein said decision mechanism decides that said clutch is connected when said rotation variation coefficient is below the preliminarily determined threshold and that said clutch is disconnected when said rotation variation coefficient is above the preliminarily determined threshold.
- 22. (New) The method fro detecting clutch connection/disconnection for a single-cylinder engine as set forth in claim 11, wherein the step of deciding decides that said clutch is connected when said rotation variation coefficient is below the preliminarily determined threshold and that said clutch is disconnected when said rotation variation coefficient is above the preliminarily determined threshold.
